

Patient-level evidence for colonocyte expression recovery

GSE92415 | Exploratory cohort | 65 paired patients

Candidate6 derived from longitudinal expression change

Fixed analysis

Genes, equal weights, aliases and primary model specified

GSE23597 | Clinical-response validation | 32 pairs

Response coefficient 0.401; 95% CI -0.481 to 1.282

GSE73661 | Endoscopic healing

IFX: positive association | VDZ: estimates positive, CIs spanning zero

GSE282122 | Longitudinal CT-colonocyte analysis

Composition and within-compartment expression assessed separately
Larger six-gene rebound from a lower baseline in remitters

Healthy-reference and reference-program extension

Within-study control comparison in bulk biopsies
Three CT programs excluding all six candidate genes

The six-gene signature rebounds during healing, with a residual bulk expression deficit after early healing. Broader reference programs show different longitudinal patterns.
